

## Iteration1 - Feedback for code

Team name: **JavaScriptDeniers**

### Instructor's feedback:

"Model: User model just include the basic user attributes. The faculty and student specific attributes are not included. Has a model for positions (Post) which has a relationship to Research model - representing the research topics that apply to positions. faculty\_info in post should be a foreign\_key to user, not a simple string field.

Use cases: User registration requires to enter the basic user information only. Registration form(s) doesn't include the faculty (specific) specific information that need to be entered during registration. "

### TA demo notes:

<b>Working features (showed during the demo)</b>	Frontend and Backend-Integrated:	Can create new postings. Can log in.
	Frontend only:	Models set up for users, faculty and students and posts.
	Backend only:	
<b>Untested and/or non-working code</b>	Frontend only:	Can create a post but flashes something went wrong despite it working correctly. Misplaced flash message. Can be registered as a student and a faculty with their register options.
	Backend only:	
<b>Comments:</b>	Dylan created landing page and register and login. Can be both a user and faculty. Will be fixed to remove the possibility of being both. Some cool UI stuff done. Bobby - Connected post to home page to display, backend and front. Plans on making it look better. Tags not currently posted made in data base just not visible. Wen - Created the posting. Backend and Front end. Keagen - reformatted and created design document.	

Score: **88**
